Why should kids play videogames? First of all, videogames are fun! The best thing about games is that they are by their very nature interactive. I can play a videogame for 3 hours and have fun and learn something at the same time. The important thing is that games teach you something. For example, in any game I play it is very common to have to learn how to work the controls. In order to succeed in games you have to develop the cognitive capacity to master the rules of your game environment. It is only logical to assume that videogames are a great tool for cognitive development. Second, they are extremely versatile. They can be entertainment, work, training, therapy, homework or even a healthy alternative to TV. They are also inherently scientific because you can easily measure and interpret how much time you spent on a game. More importantly, because the technology in videogames has evolved in recent years, kids are learning stuff at a much faster rate. Instead of passively sitting in front of a TV, watching a movie, or doing homework, kids can now learn stuff using videogames. In many cases they are also learning concepts faster and have a lot of fun doing it! Third, games are really effective for problem solving, especially because of the vast amount of complex problems they allow you to solve. I personally like to use videogames for one thing and one thing only: to teach people how to play a game. Games are simple rules that can be really hard to understand. If you show someone how to play a videogame they can later understand any videogame and be really good at it. This is very important when I teach people how to play videogames in my lab. In order to create a fun and useful experience I developed a specific concept called Wisdom which I call "Bring the Power of Psychedelics into the Lab". In it I explain how Psychedelics fit into the predictive coding model of the brain and how this can be used to explain the effects of psychedelic molecules on the brain. In Wisdom you can hold the psilocybin molecule and fit it into the receptor and you can even experience and understand how synesthesia happens. To help you understand the neuroscience behind Wisdom I also developed a very cool 3D tutorial for the game. In the game you can use the mouse to zoom in and out, rotate and change the focus of the molecule. Now that you have learned a little about why games are so important and how they can be used

While the comet dust affects the accuracy of the spacecraft, this time it's an asteroid that's glowing brightly. Exploring the inner regions of a star system can be a dangerous experiment. An explosion projected this morning between the USS Stennis and an Argentinian missile cruiser set off a fire that actually forced the captain to not only put out the blaze, but also to not only sit out the fire, but to kick all the crew out of the ship. To challenge this

explosion or not is up to you the scientists and senior officers of this USS Stennis. While this is just a game and an introduction to realism, if you have a real insurgency and war inside your borders, and you suspect a conspiracy, it is better to actually withdraw and declare martial law than simply allowing innocent people to die. It's not all that hard to get a rocket into orbit around the earth, but it's a lot harder to get into orbit around any other celestial body. The space station however, orbits right over the equator. On the surface of the earth, if you launch a rocket heading north, it's also heading north, but if you launch a rocket heading south, it's also heading south. North of the equator the rocket is heading south, so it looks like it is following a ball, or circle, going north, and so it flies into the atmosphere at a lower than desired angle. Once you have gone around the planet enough, that ball no longer appears to be moving at all (it is), and you need to adjust the trajectory. It doesn't sound like much of a challenge, but if you try it in game, you will soon discover why this is such a difficult task. Also, once a space station exists, it is a very convenient target for anything with missiles, let alone other smaller targets such as spy satellites or highflying spacecraft. The first question is what to call the space station? There are two versions floating around out there, but it seems that most use the name Scifi IV. The easy choice to me was to use the name Altair, because it's the first operating space station in the history of humans or machines or aliens, and the original name of any interstellar space station. As far as I
