I felt that my review of the previous version of Lightroom would have been incomplete without mention of a large influence in the design of the new version: there have been dramatic improvements in the way the software consumes memory. You may recall back in 2016 that I had two concerns about Lightroom: it would take up much more memory than a competitor, and it would not clean up files very well. Since then, I've gone through at least a dozen laptops from which to choose for testing, all of which have had different amounts of memory. From a memory standpoint, Lightroom 5.2 performs at least as well, if not better than Lightroom 4.2.4. I was pleasantly surprised that Lightroom didn't have to be turned off to remove most caches. In fact, if you remove a catalog, Lightroom will, as a result, increase the number of caches available. The new real-time response filters make the changes instantly obvious, but the settings, while intuitive, took some getting used to. For example, I originally had "Highlight Skin Spots" turned off. It was the default setting and, on a couple of slides, I wanted to block out everything except for my subject's face. Because the new feature is so useful, I turned it off as soon as I realized my mistake and I was right back to my desired setting. Because I'm interested in how the latest AE update handles common tasks, I've compared it in depth with popular photo-editing software, namely Affinity Photo, Affinity Photo Elements, Adobe Lightroom 6, Photoshop, and Photoshop Elements.

Have you ever been thrilled with the use of something in Photoshop, and thought, 'Oh, I can do that in Windows Paint'? I've been there. It seemed like an awesome way to save on RAM since you are not loading Photoshop. However, what you get in Windows Paint is usually not what you get in Photoshop. Photoshop has so much more to offer and the only way to start appreciating the capabilities is by viewing video tutorials and reading books. Have you ever wanted to reference a certain feature of Photoshop or another in a different program? I haven't but I do use this: It's a feature in Photoshop and it's a site that you can use to check out the features by clicking on it. I accessed this when I didn't know what "Echo" meant in Photoshop. Depending on who you ask, the answer to what software is best for web design will vary. Some people will say that HTML editors like Dreamweaver are ideal for web design. But, other people will say a graphic design application such as Adobe Photoshop can do the job just as well. One major gripe I have with HTML editors is that they really don't handle graphics very well. Photoshop and GIMP are two great graphic design alternatives. Adobe Photoshop is still the most popular editor/program created for image manipulation. No matter what version you purchase of the software, you will be able to create and edit images and adjust their exposure/contrast.
