Fast forward to 2015, where we're starting to see solid-state drives as the standard on computers below the mid-point of our investment curve. We are very well past the point where we can use the 3D application programming interfaces (APIs) to have the maximum benefits of RAM. AMD and NVIDIA have rewritten the software in their respective APIs, and with each rewrite we're accumulating additional source code, test data, and performance data. The version 2.0 of the 2D API is a significant rewrite of the PS OpenGL API, and we're now beginning to accumulate the same performance data with that API. Given this context, we've decided to retire the legacy 2D APIs for the 2D interface and we're going to commit to having the 3D API adopted for new applications in the future. This is going to be a big shift, but we know that we have to make this change to make Photoshop faster for our users. Along with this shift, we are introducing a brand new product called Photoshop Insights - a brand new all-in-one tool to better determine texture, lighting and color that will help you in your creative decisions before you put those colors to canvas. This tool is not only going to help you in your workflow - this is more than just a product for professionals; from the very beginning, we are optimizing this tool for amateurs who love to get creative with their photos. This product is our first attempt to help you before you get to editing. Our plan now is to work in parallel to bring you, the user, to a point where you can edit directly on the device of your choice. We're making good progress with the Camera Raw - an all-in-one application for your raw images. We understand that the use of third party apps on raw images has been a nightmare for a long time. In our latest update, we're bringing you the functionality to edit directly on the raw images. You can see this progress in the Quick Look feature in Photoshop on mobile devices. Visually, you're already editing a good selection of your photos.
