Photoshop and Lightroom are two of the most common tools within the program. Work on your photos with individuals all over the world, and get their help when you're stuck for ideas. All of Adobe Photoshop's rich features can be applied in a 3D environment, and it is used for everything from designing clothing for the latest film, to creating virtual props for Unreal Engine. It is also an essential tool for the web design and development community, where it is used to create the web pages for some of the world's best-known sites (e.g. Google , Facebook , and Twitter). Like most tools designed for 3D, Photoshop can rely on two dimensions in the rendering of cameras and projections. Like the well-known Adobe Go To 3D feature in older versions, Photoshop relies on the "Camera Projection" and "Perspective" tools. To accomplish this, a new projection called "Spherical Projection" (an extension of "Perspective") enables the 3D scene to appear flattened onto a surface, whether it is a single photo or across multiple photos of the same object and surrounding imagery, such as creating a panorama. The 3D scene can then be manipulated and animated in every way one would expect from a 3D system.
